Using SSH to Import and Export your Data and Databases

You can export your database by using the `mysqldump` command.

From the SSH command line, enter the command:

```
mysqldump your_db_name > your_db_name.dmp
```

This will push all data from the specified database into a dump file for backup.

To import data from a dump file you can simply direct it into the MySQL command.

```
mysql your_db_name < your_db_name.dmp
```

Important Note: Replace `your_db_name` with the name of your own database
